Understanding Linear Equations

What Is a Linear Equation?

A linear equation is an algebraic equation in which the highest power of the variable(s) is one. These equations graph as straight lines on the coordinate plane, hence the name "linear." The general form of a linear equation in two variables (x and y) is:

``plaintext

$$ax + by + c = 0$$

``

where:

- a, b, and c are constants (with a and b not both zero),
- x and y are variables.

Alternatively, it can be written in slope-intercept form:

``plaintext

$$y = mx + b$$

``

where:

- m represents the slope of the line,
- b is the y-intercept.

Key Components of Linear Equations

Slope (m)

- Represents the steepness or incline of the line.
- Calculated as the ratio of the change in y over the change in x between two points:

```plaintext

$$m = (y_2 - y_1) / (x_2 - x_1)$$

```

Y-Intercept (b)

- The point where the line crosses the y-axis.
- When $x = 0$, $y = b$ in the slope-intercept form.

Standard Form

- An alternative way to represent linear equations:

```plaintext

$$Ax + By = C$$

```

where A, B, and C are constants, and A, B are not both zero.

Methods to Solve Linear Equations

1. Graphical Method

- Plotting the equation on the coordinate plane.
- Find the points where the line crosses the axes.
- Useful for visual understanding but less precise for exact solutions.

2. Substitution Method

- Used when two equations are given.
- Solve one equation for one variable, then substitute into the other.
- Example:
- Given:

```plaintext

$$y = 2x + 3$$

$$3x + y = 7$$

```

- Substitute y into the second:

```plaintext

$$3x + (2x + 3) = 7$$

```

- Solve for x, then find y.

3. Elimination Method

- Add or subtract equations to eliminate one variable.
- Best when coefficients are the same or additive inverses.
- Example:
- Equations:

```plaintext

$$2x + 3y = 6$$

$$4x - 3y = 8$$

...

- Add equations:

``plaintext

$$(2x + 3y) + (4x - 3y) = 6 + 8$$

...

- Simplifies to:

``plaintext

$$6x = 14$$

...

- Then solve for x and substitute back.

#### 4. Cross-Multiplication (for equations in fractions)

- Used when equations involve fractions.
- Multiply across the denominators to clear fractions and solve.

**Question** What is a linear equation? A linear equation is an algebraic equation in which each term is either a constant or the product of a constant and a single variable, typically written in the form  $y = mx + b$ . How do I identify the slope and y-intercept in a linear equation? In the slope-intercept form  $y = mx + b$ , 'm' represents the slope and 'b' represents the y-intercept. Recognizing this form makes it easy to identify both components. What is the standard form of a linear equation? The standard form of a linear equation is  $Ax + By = C$ , where A, B, and C are constants, and A and B are not both zero. How can I graph a linear equation quickly? To graph a linear equation, find the y-intercept (b), plot it, then use the slope (m) to find a second point. Draw a straight line through these points. What is the slope-intercept form and why is it useful? The slope-intercept form is  $y = mx + b$ . It is useful because it directly shows the slope and y-intercept, making graphing and understanding the line easier. How do I solve a system of linear equations? You can solve a system of linear equations using substitution, elimination, or graphing methods to find the point(s) where the lines intersect. What are parallel and perpendicular lines in terms of their slopes? Parallel lines have equal slopes ( $m_1 = m_2$ ), while perpendicular lines have slopes that are negative reciprocals ( $m_1 = -1/m_2$ ). What is the importance of the discriminant in linear equations? The discriminant helps determine the number of solutions in a system of equations; for linear systems, it indicates whether solutions are unique, infinite, or none. Can a linear equation represent a vertical or horizontal line? Yes. A horizontal line has the form  $y = k$ , and a vertical line has the form  $x = h$ . These are special cases of linear equations. Where can I find the best cheat sheets for linear equations?
