What is Space?

Space is the final frontier that lies beyond Earth's atmosphere. It starts at the Kármán line, which is located approximately 100 kilometers (62 miles) above sea level. Space is a near-perfect vacuum, meaning it lacks air and matter, making it inhospitable for humans without special suits and equipment. The immense emptiness is punctuated by stars, planets, and other celestial bodies, all held in their orbits by gravity.

The Solar System

Our solar system consists of the Sun and all objects orbiting it, including planets, moons, asteroids,

and comets. The Sun is a star that provides light and heat essential for life on Earth. The planets are divided into terrestrial planets (Mercury, Venus, Earth, Mars) and gas giants (Jupiter, Saturn, Uranus, Neptune).

Tools for Observing Space

Understanding space relies heavily on technology:

- Telescopes allow us to see distant objects in detail.
- Satellites orbit Earth to monitor weather, communication, and space phenomena.
- Space probes explore planets and other celestial bodies directly.
- These tools help scientists gather data about the universe's structure and composition.

The Universe Beyond Our Solar System

Beyond our solar system lie countless stars and galaxies. The Milky Way is our home galaxy, containing billions of stars. The universe is expanding, a discovery supported by observations of distant galaxies moving away from us. The Big Bang theory explains the universe's origin from a hot, dense state approximately 13.8 billion years ago.
