Sample Earth Science Semester 2 Exam Questions and Model Answers

Providing sample questions along with well-explained answers can help students prepare effectively. Here are some typical questions and comprehensive answers:

Question 1: Describe the process of seafloor spreading and its significance in plate tectonics.

Answer:

Seafloor spreading is a geological process where new oceanic crust is formed at mid-ocean ridges as magma rises from the mantle. This process occurs at divergent plate boundaries, where tectonic plates move away from each other. As magma reaches the surface, it cools and solidifies, creating new crust that pushes the older crust outward. This continuous process results in the widening of ocean basins and is fundamental to the theory of plate tectonics. It explains the movement of continents, the formation of underwater mountain ranges, and the distribution of earthquakes and volcanoes along mid-ocean ridges.

Question 2: Explain the difference between weather and climate, providing examples.

Answer:

Weather refers to the short-term atmospheric conditions in a specific area, including temperature, humidity, precipitation, wind speed, and cloud cover. For example, a rainy afternoon with temperatures of 20°C is a weather condition. Climate, on the other hand, describes the long-term patterns and averages of weather over a region, typically over 30 years or more. An example of climate is the tropical climate of the Amazon rainforest, characterized by high temperatures and high annual rainfall. While weather can change daily, climate reflects the overall trend and typical conditions of a region.

Question 3: List and describe the three main types of rocks and how they are formed.

Answer:

- Igneous Rocks: Formed through the cooling and solidification of magma or lava. Example: granite (intrusive) and basalt (extrusive).
- Sedimentary Rocks: Created from the accumulation and compaction of mineral and organic particles, often in water bodies. Example: sandstone and shale.
- Metamorphic Rocks: Result from the transformation of existing rocks under high pressure and temperature without melting. Example: marble from limestone and slate from shale.

Question 4: What are the main factors influencing climate change?

Answer:

The primary factors influencing climate change include:

- Greenhouse Gas Emissions: Increased levels of CO₂, methane, and nitrous oxide trap more heat in the atmosphere.
- Deforestation: Reduces carbon absorption, increasing atmospheric CO₂.
- Fossil Fuel Combustion: Burning coal, oil, and gas releases greenhouse gases.
- Industrial Activities: Contribute to pollution and greenhouse gases.
- Natural Factors: Volcanic eruptions and solar variations can also influence climate but are less significant compared to human activities.
